

# Different sources energy across countries

This is about these three countries comparing the energy sources and these are the countries: Iceland, Singapore and France. And you come to know which country is having the highest proportion of renewable energy.

In Iceland is the main sources that they are using hydropower. Hydropower is 70% of the energy sources (the other sources which is most common used in Iceland is Geothermal).

Singapore energy sources consists most out of Liquefied natural gas, which is the clean form of fossil fuel, as it produces the least amount of carbon emissions per unit of electricity.

In France is the energy sources are generated from five primary sources: coal, natural gas, liquid fuels, nuclear power, and renewables. The most common used energy sources from the five primary sources: nuclear power. Nuclear power is about 78% of their energy sources. Nuclear power is not a very proportion of renewable energy.

Singapore has the most highest proportion of renewable energy. And that's because they have the cleanest fossil fuel because it produces the least amount of carbon emissions per unit of electricity.
